URTICA URENS MOTHER TINCTURE

A Homeopathic Mother Tincture

Almost every email I receive in reference to cats has to do with a kidney or bladder problem...either infections or crystals/stones. For dogs it is most often for digestive problems, calcium deposits, yeast infections and kidney/bladder disorders. All of these symptoms for either dogs or cats have to do with the system being too alkaline. A carnivores pH range should be between 5.5 and 6.5 This pH balance is very important for a myriad of reasons and kidney/bladder infections and stones, digestive ailments and yeast infections seem to be top on the list.

A great indicator of being too alkaline is stain or plaque on the teeth. Do not brush your dog or cat's teeth. There isn't a wolf or mountain lion that uses a toothbrush...and yet they certainly have gleaming white smiles. That's because they are eating raw food and keeping their systems acidic.

Mother Nature has it all figured out; we just have to provide our domesticated animals with the proper food and nutrients and their systems will be healthy as well. So by not brushing you will see any discoloration or plaque on the teeth and that is your first indication that your dog/cat needs Urtica Urens Mother Tincture to get the body's pH back in balance and be more acidic.

Yeast infections are another indicator...especially for dogs...that the system is too alkaline. Symptoms are constant scratching of either side of the torso, licking the genital area and/or the paws incessantly, chronic ear infections and often a yeasty odor to the body and especially the ears.

Urtica Urens tincture helps the body to build up the acidity which in turn helps with digestion and utilization of calcium, thus dissolves plaque, crystals/stones or other calcium deposits.

You must use the mother tincture which is a liquid. Do not get Urtica Urens in a potency (e.g. 6x, 6c, 30c). It is only in the mother tincture form that it helps to create the acidity.

If you have cats...even though they are presently healthy...you must keep Urtica Urens Mother Tincture on hand because there is always a possibility of a urinary infection or blockage and you will need it immediately. I cannot tell you how many cats this product has saved...and how much money it has saved for the guardian...because instead of rushing your cat to the emergency room, you start giving the Urtica Urens and usually within an hour or two s/he is urinating again.

I stress the importance with cats; however, I am seeing these same kidney/bladder problems in dogs...especially small dogs...quite often now.

In medium and large dogs I am seeing yeast infections. I attribute this regression to the fact that each generation is getting more and more alkaline because they are eating cooked, canned, dry food, being fed the wrong type of calcium or none at all and are given vaccines which devastate the system...therefore, we are seeing more yeast problems, kidney and bladder infections and stones.

Directions for use:

If you see stain or plaque on the teeth:

The suggested dosage of Urtica Urens tincture is one drop per pound of body weight per day...in other words, a ten-pound dog/cat would get ten drops of Urtica Urens in his/her food once a day.

My Pet...Naturally

If you are dealing with yeast problems:

The suggested dosage of Urtica Urens is one drop for every two pounds of body weight to start...in other words, a fifty-pound dog would start with 25 drops per day in his/her food. After one week if the symptoms of the yeast infection aren't getting any better, then I would increase to one drop per pound of body weight until the dog has some relief; then go back to the original dosage of one drop for every two pounds of body weight until there are no symptoms of the yeast infection.

If your cat/dog shows any signs of scant urine, urinating too frequently, not urinating often enough or urinating in unusual places, then you should dilute Urtica Urens purified water and give with a syringe, dropper or spoon and give one drop of Urtica Urens per one pound of body weight, but increase the number of times you give it to three to four times a day. The reason you want to dilute it in water is to cut the sharp taste of the Urtica Urens.

If your cat is in and out of the litter box or your dog is wanting to go out all the time and they are urinating just a couple of drops at a time, not urinating at all, and/or are straining, give the above dosage every 15 minutes until s/he has a normal quantity of urine.

If your cat/dog has the above symptoms and does not urinate within two to three hours of giving the Urtica Urens every 15 minutes, you need to go to the veterinarian.

However, the first thing you want to know from the veterinarian is

whether the bladder is full or do you have more time to continue to give the Urtica Urens,

1. if it is full, can it be easily expressed to give you more time,
2. if it is full and blocked, then you will indeed have to allow the veterinarian to insert a catheter to drain the bladder,
3. the veterinarian may also suggest flushing the system by giving an IV, which is also a good idea.

By no means allow them to operate and remove the penis.

Unfortunately, this is suggested and done over and over, because most veterinarians do not know about Urtica Urens. As I'm sure most men will agree, amputating the penis is never a solution. That surgery only compounds the problem, because now your male cat has an opening that cannot be opened and closed, causing hygienic problems, discomfort, open to injury, chronic infections, and every time he gets in the litter box and buries his urine or feces, he will fling litter into that open area with the possibility of all other types of infections and problems.

After the blockage is cleared, continue to give Urtica Urens on a regular basis. Once there has been a blockage that means your dog/cat already has a predisposition to the problem and it could occur at any time again...either because s/he is continuing to pass crystals/stones or reoccurring infections.

Continue to watch the color and condition of the teeth to indicate to you if the pH is staying in balance.

You need to have this product on hand if you have a cat/dog with any probability of urinary blockage. Ordering after you see the problem is too late!

An added feature is that Urtica Urens is excellent for burns, insect bites, rashes or swelling. Keep the bottle handy in the kitchen. Apply it full strength immediately on any affected area. The stinging, swelling, redness, pain will often not even materialize.
