IS YOUR ANIMAL ILL? DEHYDRATED? NOT EATING?

By Pat McKay

You can make up a quick fix using what you might have available at home, such as a raw egg broth or a raw meat broth. Both of these broths are easy for your animal to digest during illness, dehydration, and/or if you are concerned because they are not eating.

Egg broth: One RAW egg yolk (the yellow), mix with just enough purified water to be soupy and serve.

Raw meat broth: One tablespoon of RAW ground meat, add to one-half cup of purified water, mash the meat in the water with a fork or put it through a blender or food processor and serve.

Raw vegetables juices can be added as well. Once you have juiced any vegetables, you have taken all the nutrients out of them, so never feed the leftover fiber to your animals. Add small amounts of juice to the broth depending on the size of your dog or cat.

Do not give vegetable broth by itself. Carnivores need the protein from the egg or meat broth. Do not mix proteins either. In other words, do not mix the egg broth with the meat broth. Proteins must be given separately.

If your animal is too ill to eat on his/her own, give either of the above broth liquids with a syringe or a spoon.

Any of the broths or juices must be given within 15-20 minutes after preparing them because once you have exposed the nutrients, they will dissipate quickly.

If you prepare more than your animal will take, then give it to a healthy animal in your family or throw it out. Prepare a fresh mixture each time you give it.

If you have any of the following products on hand, add them to the broth: Aloe, Digestive Enzymes, Probiotics, MegaH, or Crystal Energy available, add those as well.

The broths will sustain your animal until you can get more information on what to do next from a professional or get your animal to an emergency facility, whatever is needed at the time.
